## Project Description

This will pretty much be a re-iteration of the proposal, but we're no longer using uddi

## Technologies Used

so info on the technologies and how we used them/what we used them for

### **Jax-WS**

To publish server end points

### **Java RMI**

to maintain a list of active servers

### **SQL - @ed "is it sql or mysql?"**

each server has it's own sql db, used to keep track of votes.

# The Raft Algorithm

## Basic Principle

what is does

and

steps,

1. start as follower
2. elect leader
3. heartbeat
4. if no heart beat, elect new leader

## Electing a leader

me me me me

## Heart Beats

badump

## Our Implementation

Consists of the following 3 parts

### Clients

look to rmi for current leader  
do votes  
request winner from leader

### Servers

a server has 3 parts

**The Raft Element**

**The Coordinator**

**The Database**

### jgUDDI

because jUDDI was too hard

## Conclusion

it was fab
